

CLAIMS

1. A cover for handles for use under sterile conditions, comprising:

- a flexible, foldable bag open at one end, to cover
5 said handle;
- an annular skirt for holding the entire periphery of
a portion at the open end of said flexible bag;
- a ring for snugly holding said portion against the
inner surface of said skirt;
- a first set of spikes protruding inwards from the
10 inner surface of said skirt, pointing towards the
axis of said skirt, and wherein said spikes are of
uneven length, and
- a second set of spikes protruding inwards from the
15 inner perimeter of said ring.

2. A method for providing a sterile cover to a handle in an

operating room comprising unfolding a folded sterile bag, with its
open end directed towards said handle, starting said unfolding
20 from the end of said handle, sliding said bag along said handle,
and wherein said bag is kept in place by at least one set of
spikes such that spikes of different lengths exert force on said
handle depending on their respective lengths, and wherein at

least some of said spikes exert force on said bag against said handle.
